Question **3**

Not yet answered

Marked out of 5.00

Replace the main function in newmain.c by this (i.e., it remains as in the second version) :

```
int main(void) { struct x X; X.f = X.i; printf("%d\n",f(X)); return 0; }
```

And replace the f function body in structure.c by:

```
int f(struct x X) { return X.i-((int)X.f); }
```

Then again compile and link structure.c and newmain.c together to produce a single executable, and run that executable 5 times, and write the output in 5 sections separated by a blank line each. **Also explain the output of both the versions, the previous one and this one.**
